### Abstract

The main goal of this project is designing a task that demonstrates that the usage of neuromodulators can influence the evolution of a neural network in a positive way. For implementation and simulation of the task we use SIMMA "a simulation framework mainly developed for the simulation of mobile autonomous robots and their behaviour".

## 1 Introduction

In this class our team of four people design a task for neural networks. The main goal is to demonstrate that the usage of neuromodulators can influence the evolution of a neural network in a positive way. After careful considerations we decided to implement a robot whose task it is to take several pegs to a certain place. By delivering the pegs to the certain place the robot has to avoid an enemy. If the robot is captured by the enemy, he will get damage, which effects its speed. The robot will learn this task by means of neural networks. We hope that neuromodulators will influence the evolution of our neural network in a positive way. So the neuromodulators assist our robot by learning this task. For implementation and simulation of the task we use SIMMA "a simulation framework mainly developed for the simulation of mobile autonomous robots and their behaviour".

## 2 SIMMA

SIMMA (Simulator for EMMA) is ...

## 3 The task

### 3.1 The Robot

### 3.2 The Enemy

### 3.3 The Fitness Function

## 4 Results

## 5 Conclusion
